Vectors are DNA molecules that carry foreign genetic material into host cells. They are essential because they:

- Provide a means to replicate the inserted gene within host cells.
- Contain selectable markers (such as antibiotic resistance genes) to identify successful transformations.
- Often carry features that facilitate the insertion of DNA fragments, such as multiple cloning sites.

Common vectors include plasmids, viruses, and artificial chromosomes.

3. How do scientists ensure that the recombinant DNA is successfully inserted into host cells?

Answer:

Scientists employ several methods:

- Selection markers: Using antibiotic resistance genes so that only cells with the recombinant DNA survive on selective media.
- Blue-white screening: Insertion of DNA into the lacZ gene of plasmids results in white colonies, indicating successful insertion.
- PCR and Gel Electrophoresis: Confirming the presence of the gene of interest in host cells.

4. What safety precautions should be taken when working with recombinant DNA?

Answer:

Safety is paramount in genetic engineering labs:

- Use of personal protective equipment (PPE) such as gloves and lab coats.
